

Reduce once. Choose the operating point later.

Fix the source law, action set and loss. Then preserve every action's regret.

SAME COMPLETE ONE-STEP RATE-REGRET CURVE

$R_x(D) = R_g(D)$ For every feasible target D , with finite action sets.

Why not keep only the best action?

x_1 and x_3 both favour A, but choosing B costs 2 in one and 5 in the other. They must stay separate.
